

Internship Test

ReactJS Developer Profile Set-1

Guidelines:

Please follow the following pointers while doing the assignment:

1. Assignment duration: 1 day (we expect the assignment in full)
2. Attach a Readme to your code
3. Use react router for routing
4. Use redux for state management
5. UI and functionality :
 - Add login/signup to your portal with minimal but relevant login details
 - Use localStorage/sessionStorage to maintain the session for a logged in user
 - Create a landing page with a single input asking the user what programming language they're looking for a job in.
 - Once the user chooses a language, make a request to the Github public API searching for jobs that require developers who know said language.
 - Show the user a list of jobs with an option to view them in detail.
 - Once the user selects a job posting, make another request to the API to fetch that particular job.
 - Add another page to view that particular job and provide an option to apply.
 - Upon clicking apply, show the user a form asking them for the following:
 - Name
 - Email
 - Cover Letter Note
 - A file upload for resume, cover letter etc would be a plus
 - When the user submits the form, show them a success page with a preview of what their application looks like.
 - There is no API request involved in showing the success page, you just have to transfer the data within the app. Use state management for this.

- The design of the page, validations, rules etc are left up to you but we expect all in place
